

Assignment 5 - Deploying Web Apps on Cloud PaaS (individual)

Due 11:59pm, Monday, May 1

This is an individual assignment, which is to create a Linux virtual machine on your free Azure account, install a web server on the virtual machine, and deploy a web application.

1. Get a free Azure account. You may get a free Azure account with Azure credit in two different ways: (1) [A general account](#) with a credit card required, which provides some free services for 12 month and \$200 Azure credit for 30 days; (2) [A student account](#) associated with your university email with no credit card required, which starts with \$100 Azure credit plus popular services free while you have your credit.
2. Create a virtual machine with the cloud platform provided by Azure.
3. Obtain the Web page files from the following flight animation web site and save them on your own computer: <https://bl.ocks.org/bradoyley/d2725b17d38239e7de49c39ebdeae94f>
4. Deploy the webpages from step 3 on the virtual machine created in step 2.

Submit the URL of your website on the Azure virtual machine. Once you have received your grade for this assignment, you can take down your VM on the Cloud to save your Azure dollar credits. It costs \$3-\$5 per day when I kept both VM and Web Server up for a week so it is not exactly "cheap" to keep it up when the account is not free.

Below are some example commands you may refer to when you complete the assignment (note the IP address in the example should be replaced by your virtual machine IP):

1. To log into Azure account from a Command Prompt: `ssh -i .\myKey.pem azureuser@52.173.20.0.`
2. To transfer the two flight animation files from your own computer to Azure virtual machine:
`scp -i myKey.pem index.html azureuser@52.173.20.0:`
`scp -i myKey.pem routes.js azureuser@52.173.20.0:`
3. To move a file from your account root folder to the default root folder of the web server:
`sudo cp index.html /var/www/html`

Please note in the command examples above, you may need to replace the pem file, account name, IP address, html and JavaScript file names with your own equivalent.
